
Live Electronics Tutorial

With examples in Pure Data and the ELSE Library

Copyright © 2008–2021 Alexandre Torres Porres

Link: <https://github.com/porres/Live-Electronics-Tutorial>.

Version: 1.0-0 beta-45: Released december 18th 2021

- This particular version of the tutorial requires **Pd 0.52-0** or later and depends on ****ELSE 1.0-0 beta 45** (<https://github.com/porres/pd-else/releases/tag/v1.0-beta45>)!
-

About:

This tutorial presents theory and practice of Live Electronics topics without any prerequisite. It's aimed at newbies, dummies, enthusiasts and also experts.

This didactic work is licenced via Creative Commons Attribution–NonCommercial–NoDerivatives 4.0 International (CC BY–NC–ND 4.0), which allows downloading and sharing with proper credit. It also forbids its usage for comercial purposes. Check the license at: <https://creativecommons.org/licenses/by-nc-nd/4.0/>.

This is a didactic project developed with Pure Data (or just "Pd", a.k.a. "Pd vanilla" distribution), an open source software developed by Miller Puckette – get it at <http://msp.ucsd.edu/software.html>. Note that the major forks of Pd (Pd–Extended and Purr Data) are incompatible to this tutorial (and the ELSE library). Also Access <http://puredata.info> for other resources on Pd. The official Pd mailing list is found here: <http://li>

sts.puredata.info/listinfo/pdlist.

Pure Data is adopted in this tutorial amongst other possibilities because of its accessibility, friendliness and for being a powerful didactic tool. Nonetheless, this work relies heavily in the ELSE library for Pure Data, also developed by Alexandre Torres Porres, the author of this tutorial.

This project started in 2008 as part of a textbook for a computer music course with included examples in Pd. In 2009, the author presented a paper about it in the 3rd International Pure Data Convention. Currently, this is solely presented as example patches that the author uses in his courses/workshops. The plan now is to write a book accompanied by these examples. Originally developed in brazilian portuguese and relying on Pd Extended 0.42-5 for years, this has just been rewritten from scratch in english and ported to rely only in objects from the ELSE external library and the newer Pd Vanilla versions.

This is still in the early drafts from the first translation rounds, so typos and mistakes may exist. There are plans to include more topics as well. The developments now depend mostly on the software development of the ELSE library to include more examples. Since the ELSE library is still in an early beta stage of development, some objects may change in functionality, new objects are being developed and others might even be deleted until a final version is out. If so, future updates of this didactic material will reflect these changes.

Downloading and Installing this tutorial:

This version of the tutorial needs at least Pd 0.52-0! You can look for releases of this tutorial in <https://github.com/porres/Live-Electronics-Tutorial/releases> - where early versions of it are also still present, but it's best just to download this directly via Pd along with the ELSE library, because this tutorial is also provided as part of it (and you need to install the "ELSE" library in order to use this tutorial anyway).

So in Pd just go to the "Help" menu and click on "Find Externals", then just search for 'else' for the latest version (1.0-0beta45 by the time of this release). You can also download ELSE from its GitHub repository <https://github.com/porres/pd-else/> and it'll also contain this tutorial as part of the download. In this combo download, you'll always get compatibility between the tutorial and the ELSE library.

Once you download the library (via Pd or Github), look for the 'live-electronics-folder' inside the else folder and move it somewhere else, preferably to ~/Pd/Documents (leave ~/Pd/Documents/externals just for proper external libraries, like the ELSE library). Then you can add the folder's path (such as ~/Pd/Documents/Live-Electronics-Tutorial) to Pd via "Preferences => Path", so you can navigate through the tutorial via Pd's browser (Help => Browser).

Loading the examples from the tutorial:

Once you have the ELSE library and moved the tutorial to your preferred place, you can just open the examples. Note that the tutorial uses [declare -path else] in all the examples that need externals from the ELSE library. With this particular strategy, it is possible to run into conflicts, and by conflicts I mean loading by mistake another external from another library that has the same name as an external from ELSE. In order to avoid this, you must not have loaded such other externals from other libraries before opening Pd with these examples. One good practice is to not load other libraries via "Preferences => Startup", because this loads these externals every time Pd is started.
